### ID: 8d93d73a

$$y < 5x + 6$$

For which of the following tables are all the values of  $\boldsymbol{x}$  and their corresponding values of  $\boldsymbol{y}$  solutions to the given inequality?

A.	$oldsymbol{x}$	$oldsymbol{y}$
	3	17
	5	27
	7	37

В.	$oldsymbol{x}$	$\boldsymbol{y}$
	3	17
	5	35
	7	37
· ·	4	

C.	$oldsymbol{x}$	y
	3	25
	5	35
	7	45
	4	

D.	$oldsymbol{x}$	$oldsymbol{y}$
	3	21
	5	31
	7	41
	4	

### ID: 8d93d73a Answer

Correct Answer: A

Rationale

Choice A is correct. Substituting  ${\bf 3}$  for  ${\bf x}$  in the given inequality yields  ${\bf y}<{\bf 5}({\bf 3})+{\bf 6}$ , or  ${\bf y}<{\bf 21}$ . Therefore, when  ${\bf x}={\bf 3}$ , the corresponding value of  ${\bf y}$  is less than  ${\bf 21}$ . Substituting  ${\bf 5}$  for  ${\bf x}$  in the given inequality yields  ${\bf y}<{\bf 5}({\bf 5})+{\bf 6}$ , or  ${\bf y}<{\bf 31}$ . Therefore, when  ${\bf x}={\bf 5}$ , the corresponding value of  ${\bf y}$  is less than  ${\bf 31}$ . Substituting  ${\bf 7}$  for  ${\bf x}$  in the given inequality yields  ${\bf y}<{\bf 5}({\bf 7})+{\bf 6}$ , or  ${\bf y}<{\bf 41}$ . Therefore, when  ${\bf x}={\bf 7}$ , the corresponding value of  ${\bf y}$  is less than  ${\bf 41}$ . For the table in choice A, when  ${\bf x}={\bf 3}$ , the corresponding value of  ${\bf y}$  is  ${\bf 17}$ , which is less than  ${\bf 21}$ ; when  ${\bf x}={\bf 5}$ , the corresponding value of  ${\bf y}$  is  ${\bf 27}$ , which is less than  ${\bf 31}$ ; and when  ${\bf x}={\bf 7}$ , the corresponding value of  ${\bf y}$  is  ${\bf 37}$ , which is less than  ${\bf 41}$ . Therefore, the table in choice A gives values of  ${\bf x}$  and their corresponding values of  ${\bf y}$  that are all solutions to the given inequality.

Choice B is incorrect and may result from conceptual or calculation errors.

Choice C is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect and may result from conceptual or calculation errors.

## **Question ID 84f5f182**

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: 84f5f182

A salesperson's total earnings consist of a base salary of x dollars per year, plus commission earnings of 11% of the total sales the salesperson makes during the year. This year, the salesperson has a goal for the total earnings to be at least x times and at most x times the base salary. Which of the following inequalities represents all possible values of total sales x, in dollars, the salesperson can make this year in order to meet that goal?

A. 
$$2x \leq s \leq 3x$$

B. 
$$\frac{2}{0.11}x \leq s \leq \frac{3}{0.11}x$$

C. 
$$3x \leq s \leq 4x$$

D. 
$$\frac{3}{0.11}x \leq s \leq \frac{4}{0.11}x$$

#### ID: 84f5f182 Answer

Correct Answer: B

#### Rationale

Choice B is correct. It's given that a salesperson's total earnings consist of a base salary of x dollars per year plus commission earnings of 11% of the total sales the salesperson makes during the year. If the salesperson makes s dollars in total sales this year, the salesperson's total earnings can be represented by the expression x+0.11s. It's also given that the salesperson has a goal for the total earnings to be at least s times and at most s times the base salary, which can be represented by the expressions s and s and

Choice A is incorrect. This inequality represents a situation in which the total sales, rather than the total earnings, are at least 2 times and at most 3 times, rather than at least 3 times and at most 4 times, the base salary.

Choice C is incorrect. This inequality represents a situation in which the total sales, rather than the total earnings, are at least 3 times and at most 4 times the base salary.

Choice D is incorrect. This inequality represents a situation in which the total earnings are at least 4 times and at most 5 times, rather than at least 3 times and at most 4 times, the base salary.

#### ID: 90f7af74

A small business owner budgets \$2,200 to purchase candles. The owner must purchase a minimum of 200 candles to maintain the discounted pricing. If the owner pays \$4.90 per candle to purchase small candles and \$11.60 per candle to purchase large candles, what is the maximum number of large candles the owner can purchase to stay within the budget and maintain the discounted pricing?

#### ID: 90f7af74 Answer

Correct Answer: 182

Rationale

The correct answer is 182. Let s represent the number of small candles the owner can purchase, and let  $\ell$  represent the number of large candles the owner can purchase. It's given that the owner pays \$4.90 per candle to purchase small candles and \$11.60 per candle to purchase large candles. Therefore, the owner pays 4.90s dollars for s small candles and  $11.60\ell$  dollars for  $\ell$  large candles, which means the owner pays a total of  $4.90s+11.60\ell$  dollars to purchase candles. It's given that the owner budgets \$2,200 to purchase candles. Therefore,  $4.90s+11.60\ell \leq 2,200$ . It's also given that the owner must purchase a minimum of 200 candles. Therefore,  $s+\ell \geq 200$ . The inequalities  $4.90s + 11.60\ell \le 2,200$  and  $s + \ell \ge 200$  can be combined into one compound inequality by rewriting the second inequality so that its left-hand side is equivalent to the left-hand side of the first inequality. Subtracting  $\ell$  from both sides of the inequality  $s+\ell \geq 200$  yields  $s\geq 200-\ell$ . Multiplying both sides of this inequality by 4.90 yields  $4.90s \ge 4.90(200 - \ell)$ , or  $4.90s \ge 980 - 4.90\ell$ . Adding  $11.60\ell$  to both sides of this inequality yields  $4.90s + 11.60\ell \geq 980 - 4.90\ell + 11.60\ell$ , or  $4.90s + 11.60\ell \geq 980 + 6.70\ell$ . This inequality can be combined with the inequality  $4.90s + 11.60\ell \leq 2,200$ , which yields the compound inequality  $980 + 6.70\ell \le 4.90s + 11.60\ell \le 2,200$ . It follows that  $980 + 6.70\ell \le 2,200$ . Subtracting 980 from both sides of this inequality yields  $6.70\ell \le 2,200$ . Dividing both sides of this inequality by 6.70 yields approximately  $\ell \le 182.09$ . Since the number of large candles the owner purchases must be a whole number, the maximum number of large candles the owner can purchase is the largest whole number less than 182.09, which is 182.

# **Question ID 8ac533d5**

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: 8ac533d5

A business owner plans to purchase the same model of chair for each of the 81 employees. The total budget to spend on these chairs is \$14,000, which includes a 7% sales tax. Which of the following is closest to the maximum possible price per chair, before sales tax, the business owner could pay based on this budget?

- A. \$148.15
- B. \$161.53
- C \$172.84
- D. \$184.94

#### ID: 8ac533d5 Answer

Correct Answer: B

Rationale

Choice B is correct. It's given that a business owner plans to purchase 81 chairs. If p is the price per chair, the total price of purchasing 81 chairs is 81p. It's also given that 7% sales tax is included, which is equivalent to 81p multiplied by 1.07, or 81(1.07)p. Since the total budget is \$14,000, the inequality representing the situation is given by  $81(1.07)p \le 14,000$ . Dividing both sides of this inequality by 81(1.07) and rounding the result to two decimal places gives  $p \le 161.53$ . To not exceed the budget, the maximum possible price per chair is \$161.53.

Choice A is incorrect and may result from conceptual or calculation errors.

Choice C is incorrect. This is the maximum possible price per chair including sales tax, not the maximum possible price per chair before sales tax.

Choice D is incorrect. This is the maximum possible price if the sales tax is added to the total budget, not the maximum possible price per chair before sales tax.

SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: e1a1754e

In a set of four consecutive odd integers, where the integers are ordered from least to greatest, the first integer is represented by x. The product of 12 and the fourth odd integer is at most 26 less than the sum of the first and third odd integers. Which inequality represents this situation?

A. 
$$12(x+6) \le x + (x+4) - 26$$

B. 
$$12(x+6) \ge 26 - (x+(x+4))$$

C. 
$$12(x+4) \le x + (x+3) - 26$$

D. 
$$12(x+4) \ge 26 - (x+(x+3))$$

#### ID: e1a1754e Answer

Correct Answer: A

Rationale

Choice A is correct. It's given that the four odd integers are consecutive, ordered from least to greatest, and that the first odd integer is represented by x. It follows that the second odd integer is represented by x+2, the third odd integer is represented by x+4, and the fourth odd integer is represented by x+6. Therefore, the product of x+4 and the fourth odd integer is represented by x+4, and the fourth odd integer is represented by x+4. Since the product of x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is at most x+4 less than the sum of the first and third odd integers, it follows that x+4 and the fourth odd integer is x+4.

Choice B is incorrect and may result from conceptual or calculation errors.

Choice C is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect and may result from conceptual or calculation errors.

$$y < 6x + 2$$

For which of the following tables are all the values of  $\boldsymbol{x}$  and their corresponding values of  $\boldsymbol{y}$  solutions to the given inequality?

A.	$\boldsymbol{x}$	$\boldsymbol{y}$
	3	20
	5	32
	7	44

C.  $\begin{array}{c|cccc} x & y & \\ \hline 3 & 16 & \\ \hline 5 & 28 & \\ \hline 7 & 40 & \\ \end{array}$ 

D.	$oldsymbol{x}$	$oldsymbol{y}$
	3	24
	5	36
	7	48
	4	

### ID: b2d50dc7 Answer

Correct Answer: C

Rationale

Choice C is correct. All the tables in the choices have the same three values of x, so each of the three values of x can be substituted in the given inequality to compare the corresponding values of y in each of the tables. Substituting x for x in the given inequality yields x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x in the given inequality yields x in the corresponding value of x in the given inequality.

Choice A is incorrect. In the table for choice A, when x = 3, the corresponding value of y is 20, which is not less than 20; when x = 5, the corresponding value of y is 32, which is not less than 32; when x = 7, the corresponding value of y is 44, which is not less than 44.

Choice B is incorrect. In the table for choice B, when x = 5, the corresponding value of y is 36, which is not less than 32.

Choice D is incorrect. In the table for choice D, when x = 3, the corresponding value of y is 24, which is not less than 20; when x = 5, the corresponding value of y is 36, which is not less than 32; when x = 7, the corresponding value of y is 48, which is not less than 44.

### ID: b2d50dc7 Answer

Correct Answer: C

Rationale

Choice C is correct. All the tables in the choices have the same three values of x, so each of the three values of x can be substituted in the given inequality to compare the corresponding values of y in each of the tables. Substituting x for x in the given inequality yields x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x in the corresponding value of x is less than x in the given inequality yields x in the corresponding value of x in the given inequality yields x in the corresponding value of x in the given inequality.

Choice A is incorrect. In the table for choice A, when x = 3, the corresponding value of y is 20, which is not less than 20; when x = 5, the corresponding value of y is 32, which is not less than 32; when x = 7, the corresponding value of y is 44, which is not less than 44.

Choice B is incorrect. In the table for choice B, when x = 5, the corresponding value of y is 36, which is not less than 32.

Choice D is incorrect. In the table for choice D, when x = 3, the corresponding value of y is 24, which is not less than 20; when x = 5, the corresponding value of y is 36, which is not less than 32; when x = 7, the corresponding value of y is 48, which is not less than 44.

## Question ID 56d2643d

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: 56d2643d

The triangle inequality theorem states that the sum of any two sides of a triangle must be greater than the length of the third side. If a triangle has side lengths of  $\bf 6$  and  $\bf 12$ , which inequality represents the possible lengths,  $\bf x$ , of the third side of the triangle?

A. x < 18

B. x > 18

C. 6 < x < 18

D. x < 6 or x > 18

#### ID: 56d2643d Answer

Correct Answer: C

Rationale

Choice C is correct. It's given that a triangle has side lengths of  $\bf 6$  and  $\bf 12$ , and  $\bf x$  represents the length of the third side of the triangle. It's also given that the triangle inequality theorem states that the sum of any two sides of a triangle must be greater than the length of the third side. Therefore, the inequalities  $\bf 6+x>12$ ,  $\bf 6+12>x$ , and  $\bf 12+x>6$  represent all possible values of  $\bf x$ . Subtracting  $\bf 6$  from both sides of the inequality  $\bf 6+x>12$  yields  $\bf x>12-6$ , or  $\bf x>6$ . Adding  $\bf 6$  and  $\bf 12$  in the inequality  $\bf 6+12>x$  yields  $\bf 18>x$ , or  $\bf x<18$ . Subtracting  $\bf 12$  from both sides of the inequality  $\bf 12+x>6$  yields  $\bf x>6-12$ , or  $\bf x>-6$ . Since all x-values that satisfy the inequality  $\bf x>6$  also satisfy the inequality  $\bf x>-6$ , it follows that the inequalities  $\bf x>6$  and  $\bf x<18$  represent the possible values of  $\bf x$ . Therefore, the inequality  $\bf 6< x<18$  represents the possible lengths,  $\bf x$ , of the third side of the triangle.

Choice A is incorrect. This inequality gives the upper bound for x but does not include its lower bound.

Choice B is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect and may result from conceptual or calculation errors.

## Question ID 46f90b4a

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: 46f90b4a

$$y \le x + 7$$
$$y \ge -2x - 1$$

Which point (x, y) is a solution to the given system of inequalities in the xy-plane?

- A. (-14,0)
- B. (0, -14)
- C.(0,14)
- D.(14,0)

#### ID: 46f90b4a Answer

Correct Answer: D

#### Rationale

Choice D is correct. A point (x,y) is a solution to a system of inequalities in the xy-plane if substituting the x-coordinate and the y-coordinate of the point for x and y, respectively, in each inequality makes both of the inequalities true. Substituting the x-coordinate and the y-coordinate of choice D, 14 and 0, for x and y, respectively, in the first inequality in the given system,  $y \le x + 7$ , yields  $0 \le 14 + 7$ , or  $0 \le 21$ , which is true. Substituting 14 for x and y for y in the second inequality in the given system,  $y \ge -2x - 1$ , yields  $y \ge -2(14) - 1$ , or  $y \ge -2y$ , which is true. Therefore, the point  $y \ge -2y$  is a solution to the given system of inequalities in the y-plane.

Choice A is incorrect. Substituting -14 for x and 0 for y in the inequality  $y \le x + 7$  yields  $0 \le -14 + 7$ , or  $0 \le -7$ , which is not true.

Choice B is incorrect. Substituting 0 for x and -14 for y in the inequality  $y \ge -2x - 1$  yields  $-14 \ge -2(0) - 1$ , or  $-14 \ge -1$ , which is not true.

Choice C is incorrect. Substituting 0 for x and 14 for y in the inequality  $y \le x + 7$  yields  $14 \le 0 + 7$ , or  $14 \le 7$ , which is not true.

### $11x + 14y \le 115$

Anthony will spend at most \$115 to purchase x small cheese pizzas and y large cheese pizzas for a team dinner. The given inequality represents this situation. Which of the following is the best interpretation of 14y in this context?

- A. The amount, in dollars, Anthony will spend on each large cheese pizza
- B. The amount, in dollars, Anthony will spend on each small cheese pizza
- C. The total amount, in dollars, Anthony will spend on large cheese pizzas
- D. The total amount, in dollars, Anthony will spend on small cheese pizzas

#### ID: 3ab9020f Answer

Correct Answer: C

Rationale

Choice C is correct. It's given that Anthony will spend at most \$115 to purchase x small cheese pizzas and y large cheese pizzas. In the inequality  $11x + 14y \le 115$ , y represents the number of large cheese pizzas that Anthony will purchase. This means the coefficient 14 represents the amount, in dollars, Anthony will spend on each large cheese pizza. Therefore, the best interpretation of 14y in this context is the total amount, in dollars, Anthony will spend on large cheese pizzas.

Choice A is incorrect. This is the best interpretation of 14, not 14y.

Choice B is incorrect. This is the best interpretation of 11, not 14y.

Choice D is incorrect. This is the best interpretation of 11x, not 14y.

).		
D	3	26 52

### ID: 89f5185f Answer

Correct Answer: D

#### Rationale

Choice D is correct. All the tables in the choices have the same three values of x, so each of the three values of x can be substituted in the given inequality to compare the corresponding values of y in each of the tables. Substituting x for x in the given inequality yields x in the corresponding value of x is greater than x in the given inequality yields x in the corresponding value of x in the corresponding value of x is greater than x in the given inequality yields x in the given inequality.

Choice A is incorrect. In the table for choice A, when x = 3, the corresponding value of y is 21, which is not greater than 21; when x = 5, the corresponding value of y is 47, which is not greater than 47; when x = 8, the corresponding value of y is 86, which is not greater than 86.

Choice B is incorrect. In the table for choice B, when x = 5, the corresponding value of y is 42, which is not greater than 47; when x = 8, the corresponding value of y is 86, which is not greater than 86.

Choice C is incorrect. In the table for choice C, when x = 3, the corresponding value of y is 16, which is not greater than 21; when x = 5, the corresponding value of y is 42, which is not greater than 47; when x = 8, the corresponding value of y is 81, which is not greater than 86.

## Question ID b81a4da4

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: b81a4da4

A team hosting an event to raise money for new uniforms plans to sell at least 140 tickets before this event and at least 220 tickets during this event to raise a total of at least 5,820 from all tickets sold. The price of a ticket during this event is 3 less than the price of a ticket before this event. Which inequality represents this situation, where x is the price, in dollars, of a ticket sold during this event?

A. 
$$140(x+3) + 220x \le 5,820$$

B. 
$$140(x+3) + 220x \ge 5,820$$

C. 
$$140(x-3) + 220x \le 5,820$$

D. 
$$140(x-3) + 220x \ge 5{,}820$$

#### ID: b81a4da4 Answer

Correct Answer: B

#### Rationale

Choice B is correct. It's given that a team plans to sell at least 140 tickets before an event and at least 220 tickets during the event to raise a total of at least 5,820 from all tickets sold. It's also given that the price of a ticket during the event is 3 less than the price of a ticket before the event and that x represents the price, in dollars, of a ticket sold during the event. It follows that x+3 represents the price, in dollars, of a ticket sold before the event. The expression 140(x+3) represents the planned revenue, in dollars, from the tickets sold before the event, and the expression 220x represents the planned revenue, in dollars, from the tickets sold during the event. Thus, the expression 140(x+3)+220x represents the planned revenue, in dollars, from all tickets sold. Since the team plans to raise a total of at least 5,820 from all tickets sold, the total revenue must be at least 5,820. Therefore, the inequality  $140(x+3)+220x \ge 5,820$  represents this situation.

Choice A is incorrect. This inequality represents a situation in which the team raises a total of at most \$5,820 from all tickets sold.

Choice C is incorrect. This inequality represents a situation in which the price of a ticket before the event is \$3 less, rather than \$3 more, than the price of a ticket during the event and the team raises a total of at most \$5,820 from all tickets sold.

Choice D is incorrect. This inequality represents a situation in which the price of a ticket before the event is \$3 less, rather than \$3 more, than the price of a ticket during the event.

## **Question ID c729c1d7**

Assessment	Test	Domain	Skill	Difficulty
SAT	Math	Algebra	Linear inequalities in one or two variables	Hard

#### ID: c729c1d7

A number x is at most 2 less than 3 times the value of y. If the value of y is -4, what is the greatest possible value of x?

#### ID: c729c1d7 Answer

Correct Answer: -14

Rationale

The correct answer is -14. It's given that a number x is at most 2 less than 3 times the value of y. Therefore, x is less than or equal to 2 less than 3 times the value of y. The expression 3y represents 3 times the value of y. The expression 3y - 2 represents 2 less than 3 times the value of y. Therefore, x is less than or equal to 3y - 2. This can be shown by the inequality  $x \le 3y - 2$ . Substituting -4 for y in this inequality yields  $x \le 3(-4) - 2$  or,  $x \le -14$ . Therefore, if the value of y is -4, the greatest possible value of x is -14.
